

# DATA ANALYTICS AND REPORTING

## Client-driven Data Analytics and Reporting includes:

- *Tailored reports*
- *Bench-marking*
- *Full charge captures and verification*
- *Track actual vs. insurance allowed amounts*
- *Reimbursement variance tracking*
- *Dictation and documentation feedback*

Today, robust and meaningful analytics hold the potential power to transform a health care organization, unlock new sources of value and differentiate it from competitors.

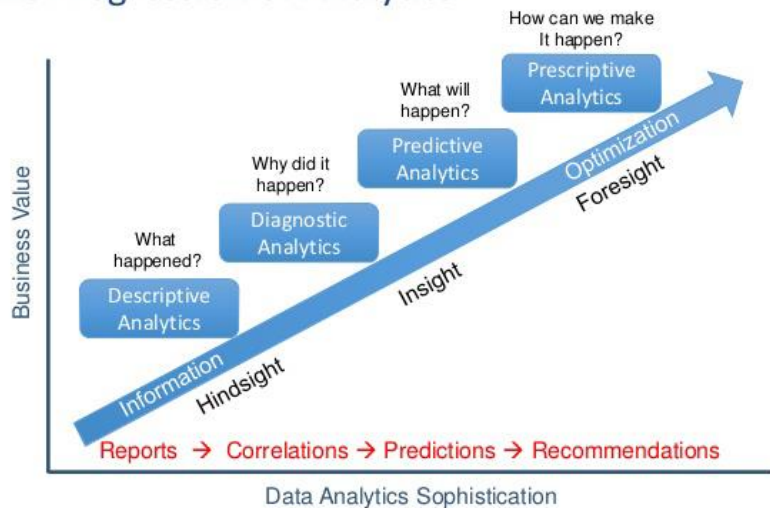

## A LEVEL OF TRANSPARENCY AND INSIGHT TO WHAT IS BEING ACCOMPLISHED ON YOUR BEHALF.

On the whole, a profitable private medical practice starts with powerful data and analytics. Accordingly, Data Analytics and Reporting is the process of inspecting, cleaning, transforming and modeling data. The goal is to highlight the most useful information. For this reason, the skill and experience to translate data into useful information can be the difference between getting ahead and being left behind.

Today, the best strategic business decisions are not made on a hunch. In fact, they don't necessarily correlate with historic "best practices". Consequently, we live in the era of big data. A profitable practice begins with robust and powerful data analytics.

For example, our team of analysts will help you identify trends and track actual vs. insurance allowed amounts. The reports provide detailed data information that is needed to manage your practice and maximize your profitability. Comparatively, this is what sets ebix apart from other Revenue Cycle Management companies. We don't just expertly code and submit. We help you identify and capitalize on unique opportunities for your practice to maximize profitability.

## The Progression of Analytics

## ADVANCED ANALYTICS

# Transform Data into Insights.

### IDENTIFY TRENDS AND TRACK ACTUAL VS CONTRACTED PAYMENTS

Every healthcare organization wants to optimize their data analysts' value and effectiveness. The ebix team incorporates all the right tools to analyze data and discover insights that would drive care and process improvement initiatives.

Data Analytics and Reporting is the process of inspecting, cleaning, transforming and modeling data. The goal is to highlight the most useful information. For this reason, the skill and experience to translate data into useful information can be the difference between getting ahead and being left behind.

Providing direction, on the other hand, leads to deeper, more meaningful insights that help solve problems and make improvements. The best report requests provide enough direction to put the healthcare organization on the right track and enough leeway to encourage providers to ask more questions as they analyze the data.

### Transparency in Reporting (limited sample reports)

Accounts Receivable Aged Trail Balance by Financial Class	Level of Service
Accounts Receivable Aged Trail Balance by Responsible Party	Location Summary
Accounts Receivable by Payer	On-Demand Statement
Average Patient Seen by Day of Week	Physician Assistant Productivity
Average Patient Volume by Hour of Registration	Physician Hourly Productivity
Charge comparison by Provider	Practice Analysis
Composite	Procedure Productivity Practice Summary
Cycle Summary	Procedure Productivity by Provider
Deposit Record	RVU Analysis by Attending Physician
Down Coding Chart	Selected Family/Patient
Encounters by Financial Class	Statement
Financial Class Activity	Summary by Class Category
Group Statement	Year-to-Year Analysis
Level of Service Compared to National Average	

The best report requests provide enough direction to help put your healthcare organization on the right track with enough leeway that encourages more questions as the data is analyzed.
